01 Manager home

UI04 / Manager

Prepare the next game and clear team tasks without entering the live match console.

Hierarchy

The next fixture is the first action. Availability counts remain distinct from actual attendance. Training and pending photo reviews sit below it.

Interaction

Prepare game opens the fixture and match squad. Home, Schedule, Team, Reports and More remain stable outside live match mode.

Role and state

The manager sees assigned-team tasks. Team and season context stay visible. No badge suggests that an availability reply proves attendance.

Build checks

Support empty season, cancelled fixture, offline cache and session-expiry states. A manager without a current assignment must not see another team’s tasks.

DESIGN STATUS

Proposed visual design. Fictional fixture, players and values. Screen behaviour is specified in the mobile build pack. Shared player labels remain a proposed policy.

02 Pre-match lineup

UI13 / Manager controller

Allocate seven starters and two available bench players before the first half begins.

Hierarchy

A clear readiness message precedes the pitch. Circular pieces show two-character initials and shirt numbers. The bench remains visually separate.

Interaction

Drag a piece or tap a player and then a slot. Both routes stage the same change. Start first half validates and commits the lineup once.

State and data

Ready offline means the fixture, squad and required settings are downloaded. Pre-match positions do not accrue player or bench minutes.

Build checks

Reject duplicate allocations, an unavailable starter, wrong pitch capacity and uncovered goalkeeper. Each piece has a minimum 48 by 48 logical-pixel hit area.

DESIGN STATUS

Proposed visual design. Fictional fixture, players and values. Screen behaviour is specified in the mobile build pack. Shared player labels remain a proposed policy.

03 Live match console

UI14 / Manager controller

Show the match state and next action while allowing the manager to keep watching football.

Hierarchy

Score and remaining half time lead. The pitch, bench summary and next-change card follow. Goal and Substitute are the primary actions.

Interaction

At 16:30 active time the next proposed change at 18:00 is 90 seconds away. A warning suggests action. It never substitutes players automatically.

State and data

The display shows only acknowledged or locally committed match events. Synced changes to Pending sync when offline. Other managers see a read-only console.

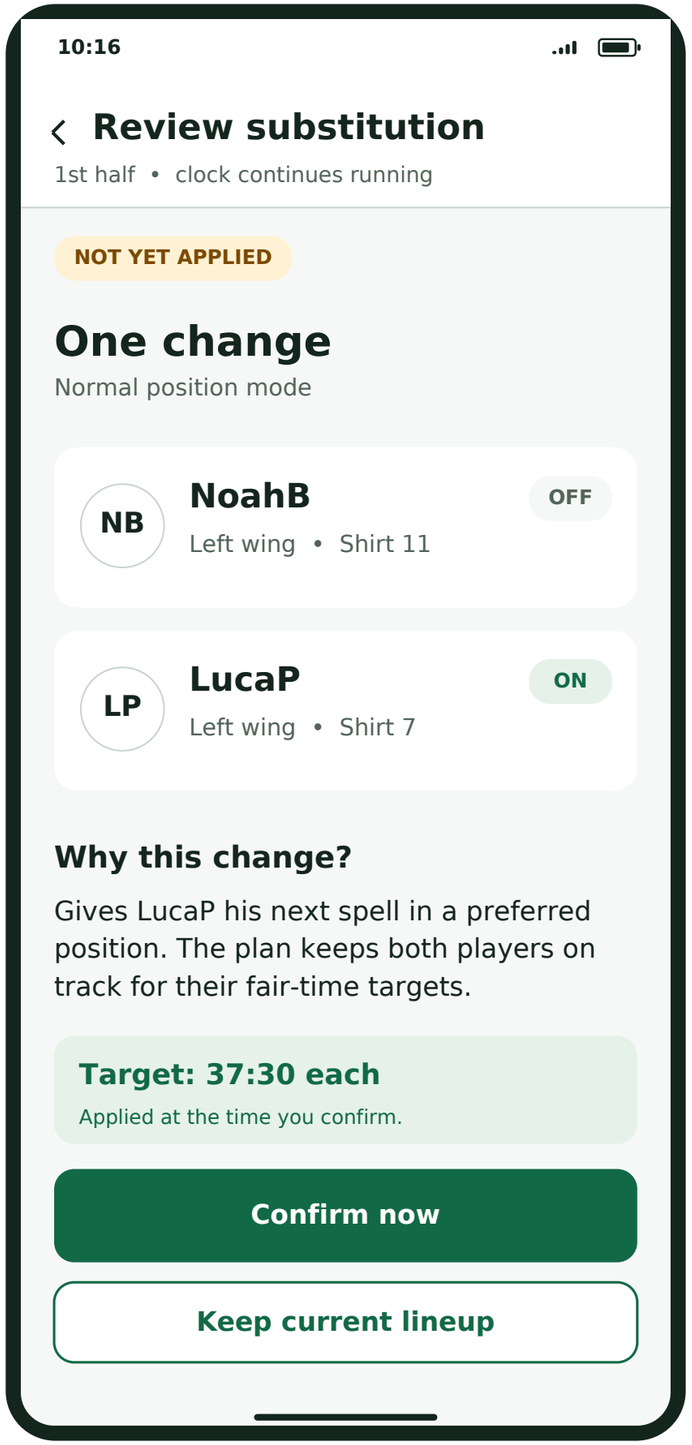

Build checks

Test sunlight, wet-hand errors, text scaling and screen-reader order. Zero on the countdown alerts the manager. End half remains a deliberate manual action.

DESIGN STATUS

Proposed visual design. Fictional fixture, players and values. Screen behaviour is specified in the mobile build pack. Shared player labels remain a proposed policy.

04 Confirm a substitution

UI16 / Manager controller

Make the proposed change explicit, then record the actual moment it is applied.

Hierarchy

The outgoing and incoming players are distinct. Position, shirt and reason are visible before confirmation. Normal position mode is identified.

Interaction

Opening the review does not change the lineup or pause play. Confirm now applies the batch at one active-game timestamp. Keep current lineup returns without applying it.

State and data

Targets are 37:30 for eight outfield players in a 50-minute, seven-a-side game with one fixed keeper and unchanged availability. No projection is presented as guaranteed.

Build checks

Revalidate availability, controller authority, score mode and lineup revision at confirmation. Repeated taps and retried sync have one effect. Keep a visible correction route.

DESIGN STATUS

Proposed visual design. Fictional fixture, players and values. Screen behaviour is specified in the mobile build pack. Shared player labels remain a proposed policy.

05 Half-time setup

UI18 / Manager controller

Allow a variable break and prepare the next lineup without adding playing time.

Hierarchy

Half-time score and clock-stopped text are explicit. The staged second-half lineup uses the same pitch interaction as pre-match.

Interaction

The manager can move players during the break. Start second half commits all staged changes together and starts the planned 25-minute second half.

State and data

The break has no fixed duration. Playing and available-bench intervals stay closed. First-half records remain intact and can be reviewed separately.

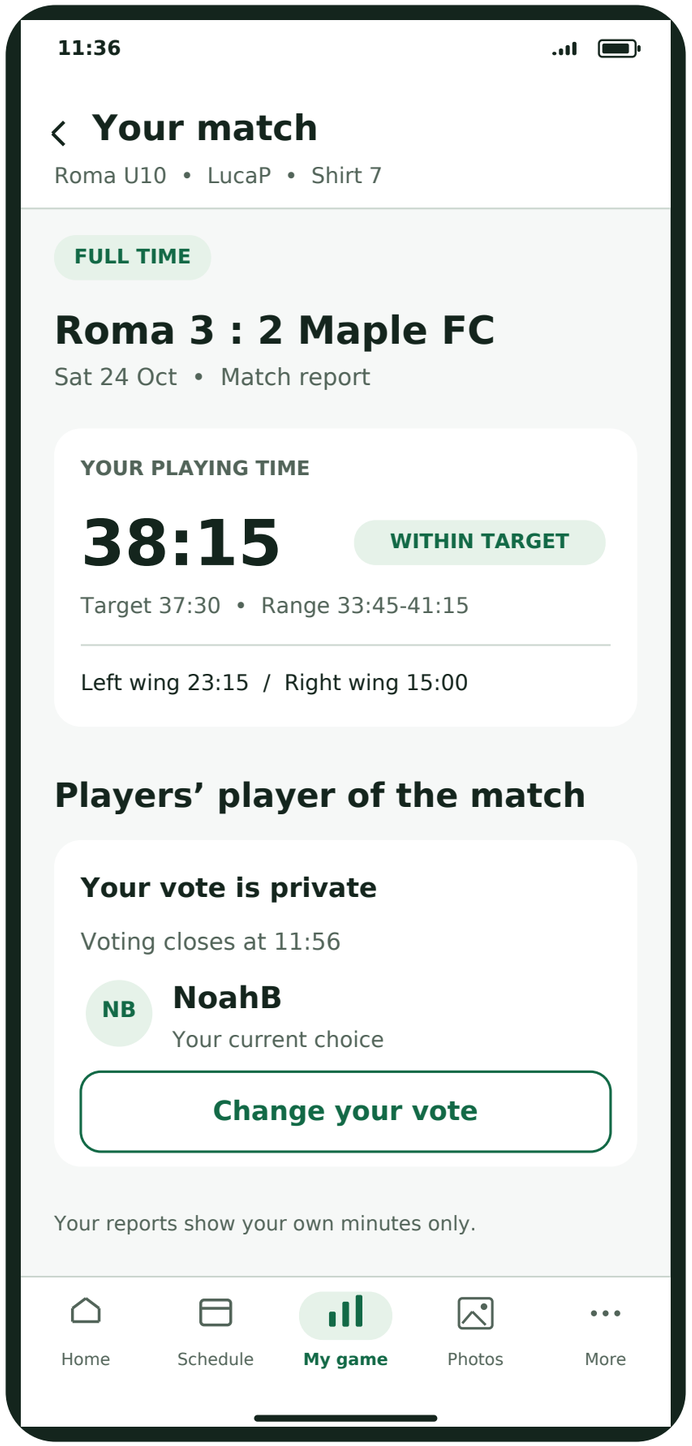

Build checks

No substitution warning sounds during the break. Restart schedules fresh alerts. The second half retains its planned length even when the first half ended early or late.

DESIGN STATUS

Proposed visual design. Fictional fixture, players and values. Screen behaviour is specified in the mobile build pack. Shared player labels remain a proposed policy.

06 Player report and vote

UI26 / UI22 / Player or shared parent access

Let a player see their own participation and cast one private teammate vote.

Hierarchy

Own minutes and own position coverage lead. The voting card is discreet. This screen never reveals another child's named attendance, minutes or ballot.

Interaction

The current choice can change before closure. The player cannot vote for themself. A parent using the same account shares this single ballot.

State and data

The example ends at 10:57. Q15 proposes closing voting at 11:56, with the result due by 11:57. Final awards can show joint winners. Confirmed votes remain distinct from pending or failed submissions.

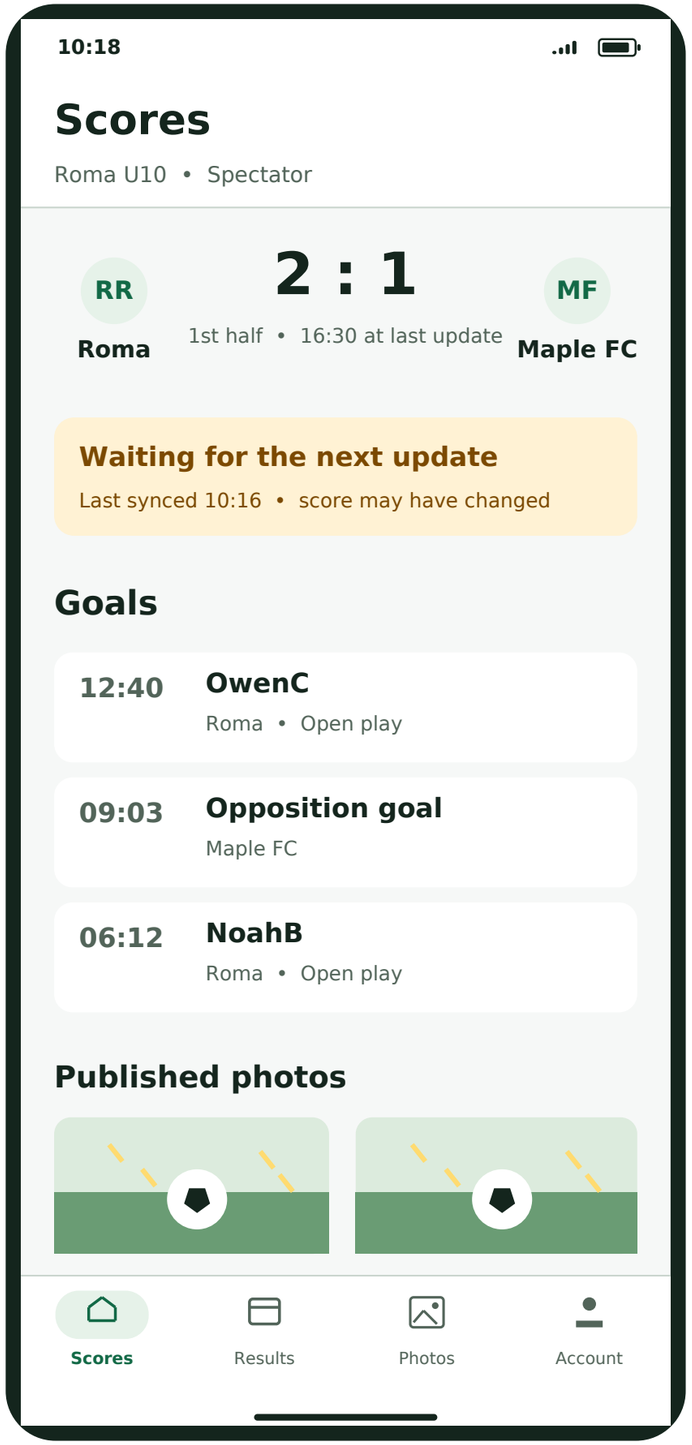

Build checks

Do not infer that the child personally cast the vote. Preserve the original cutoff when full time synchronises late. Own position minutes must reconcile to 38:15 in this example.

DESIGN STATUS

Proposed visual design. Fictional fixture, players and values. Screen behaviour is specified in the mobile build pack. Shared player labels remain a proposed policy.

07 Spectator match centre

UI21 / Invited spectator

Give invited supporters scores and scorers while making delayed information clear.

Hierarchy

The score leads. A prominent freshness message appears above goals whenever the controller has not synced. Goal times are match times, not wall-clock times.

Interaction

Scores, season results and published photos are available for the invited team. A copied link cannot grant access. Q21 competition-sharing policy must permit this audience and content. There is no vote, upload or attendance route.

State and data

The displayed 16:30 is the active match time at the last successful sync. The view must not keep advancing it as though the remote game were confirmed live.

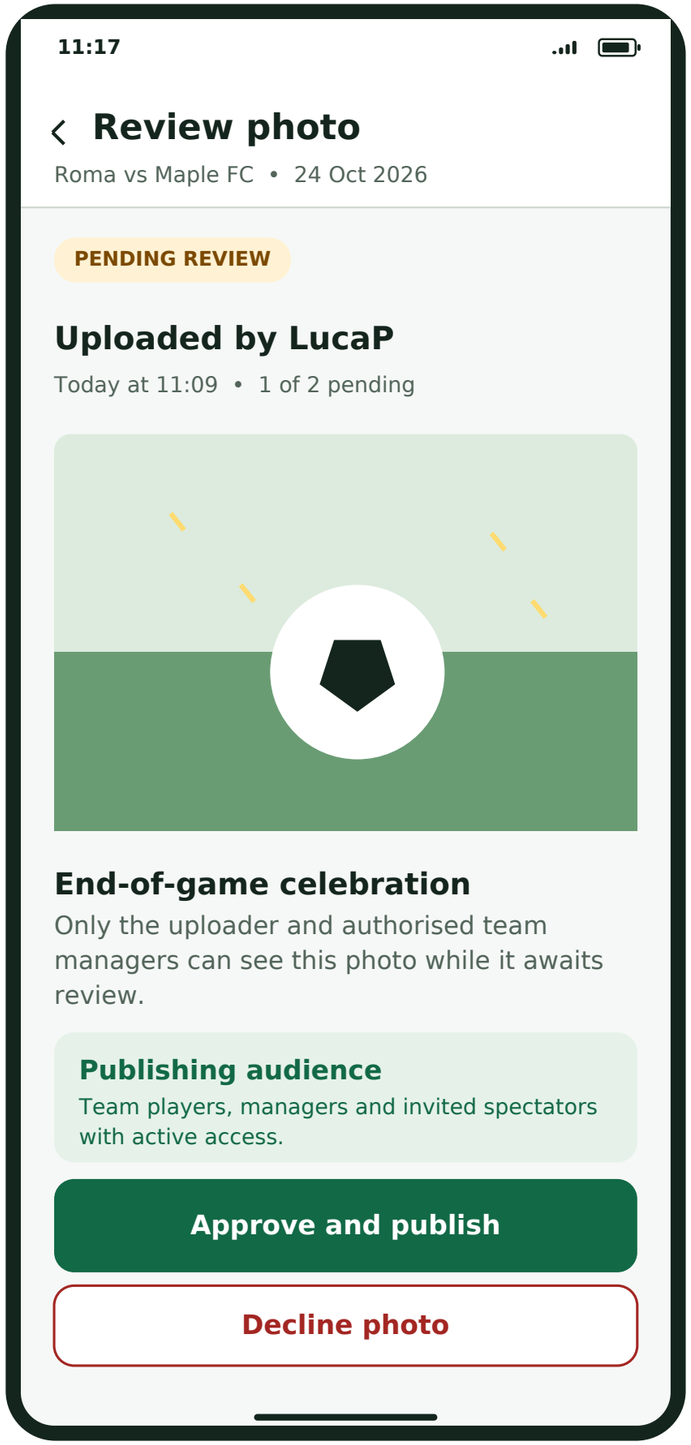

Build checks

Expired or revoked team-season access blocks all retrieval routes. Omit injuries, player-minute reports and private ballots. Thumbnail illustrations here stand in for approved photographs.

DESIGN STATUS

Proposed visual design. Fictional fixture, players and values. Screen behaviour is specified in the mobile build pack. Shared player labels remain a proposed policy.

08 Approve a player photo

UI29 / Assigned team manager

Review a player upload and show the publication audience before publishing it.

Hierarchy

Pending review is unambiguous. Uploader, fixture and upload time provide context. The intended audience is stated immediately above the approval action.

Interaction

Approve and publish makes this upload visible to authorised team viewers. Decline leaves it unpublished and follows the agreed retention and notification policy.

State and data

The original vector artwork is a design stand-in, not a submitted photograph. Real uploads require safe processing, approval state and publication permission, including the applicable competition policy.

Build checks

A player-uploaded image cannot appear in the shared gallery before approval. Managers can publish their own uploads deliberately without a second reviewer. Removal must revoke further image access.

DESIGN STATUS

Proposed visual design. Fictional fixture, players and values. Screen behaviour is specified in the mobile build pack. Shared player labels remain a proposed policy.
